

Keda Tech Test 2 - Documentation

So here's the picture of the home page.

As you can see I tried to replicate the image from the test as close as possible.

Also when the login button is pressed it will pop out the login modal.

For this component I've decided to use the **Modal** component from **React-Modal**

Also for the Navbar I've made it so that the logo placeholder there where it will say which page it's on to be dynamic.

As you can see there it's saying that we're on the home page. But when we access another page. The contents of the navbar will change dynamically as I'm using React-Router-Dom to check which page its on as well as to link the navbar to the page that you want to access.
